# 1 Overview

This guide describes how to obtain and install binary packages for the GoVivace Speech Recognition (GoVivaceSR) plugin to the UniMRCP server on Red Hat-based Linux distributions. The document is intended for system administrators and developers.

## 1.1 Applicable Versions

Instructions provided in this guide are applicable to the following versions.

 UniMRCP 1.6.0 and above  
UniMRCP GoVivaceSR Plugin 1.0.0 and above

## 1.2 Supported Distributions

UniMRCP binary packages are currently available only for x86\_64 (64-bit) architecture.

Operating System	32-bit	64-bit
Red Hat / Cent OS 7		✓
Red Hat / Cent OS 8		✓

Note: packages for other distributions can be made available upon request. For more information, contact [services@unimrcp.org](mailto:services@unimrcp.org).

## 1.3 Authentication

UniMRCP binary packages are available to authenticated users only. In order to register a free account with UniMRCP, please visit the following page.

 <https://www.unimrcp.org/profile-registration>

Note: a new account needs to be verified and activated prior further proceeding.

## 2 Installing RPMs Using YUM

Using the Yellowdog Updater, Modifier (yum), a command-line package management utility for Red Hat-based distributions, is recommended for installation of UniMRCP binary packages.

### 2.1 Repository Configuration

The content of a typical yum configuration file, to be placed in `/etc/yum.repos.d/unimrcp.repo`, is provided below.

```
[unimrcp]
name=UniMRCP Packages for Red Hat / Cent OS-$releasever $basearch
baseurl=https://username:password@unimrcp.org/repo/yum/main/rhel$releasever/$basearch/
enabled=1
sslverify=1
gpgcheck=1
gpgkey=https://unimrcp.org/keys/unimrcp-gpg-key.public

[unimrcp-noarch]
name=UniMRCP Packages for Red Hat / Cent OS-$releasever noarch
baseurl=https://username:password@unimrcp.org/repo/yum/main/rhel$releasever/noarch/
enabled=1
sslverify=1
gpgcheck=1
gpgkey=https://unimrcp.org/keys/unimrcp-gpg-key.public
```

The username and password fields included in the HTTPS URI must be replaced with the corresponding account credentials.

### 2.2 Repository Verification

In order to verify that yum can properly connect and access the UniMRCP repository, the following command can be used.

```
yum repolist unimrcp
yum repolist unimrcp-noarch
```

where *unimrcp* and *unimrcp-noarch* are names of the sections set in the yum configuration file above.

In order to retrieve a list of packages the UniMRCP repository provides, the following command can be used.

```
yum --disablerepo="*" --enablerepo="unimrcp" list available
```

```
yum --disablerepo="*" --enablerepo="unimrcp-noarch" list available
```

## 2.3 Plugin Installation

In order to install the GoVivaceSR plugin, including all the dependencies, use the following command.

```
yum install unimrcp-govivace-sr
```

In order to install the additional data files for the sample client application *umc*, the following command can be used.

```
yum install umc-addons
```

Note: this package is optional and provides additional data which can be used for validation of basic setup.

# 3 Installing RPMs Manually

UniMRCP RPM packages can be installed manually using the *rpm* utility. Note, however, that the system administrator should take care of package dependencies and install all the packages in appropriate order.

The RPM packages have the following naming convention:

```
$package-$universion-$packageversion.el$rhelversion.$arch.rpm
```

where

- *package* is the name of a package
- *universion* is the UniMRCP version
- *packageversion* is the RPM release version
- *rhelversion* is the Red Hat version
- *arch* is the architecture (x86\_64, i686, ...)

## 3.1 Package List

The following is a list of UniMRCP RPM packages required for the installation of the GoVivaceSR plugin.

Package Name	Description
<b>unimrcp-govivace-sr</b>	GoVivaceSR plugin to the server.
<b>unilibevent</b>	UniMRCP edition of the libevent library.
<b>umc-addons</b>	Sample en-US data files used with umc. [Optional]
<b>unilicnodegen</b>	Node information retrieval tool, required for license deployment.
<b>unimrcp-server</b>	Shared library and application of the server.
<b>unimrcp-client</b>	Shared libraries and sample applications of the client. [Optional]
<b>unimrcp-demo-plugins</b>	Set of demo plugins to the server. [Optional]
<b>unimrcp-common</b>	Data common for the client and the server.
<b>uniapr</b>	UniMRCP edition of the Apache Portable Runtime (APR)

	library.
<b>uniapr-util</b>	UniMRCP edition of the Apache Portable Runtime Utility (APR-Util) library.
<b>unisofia-sip</b>	UniMRCP edition of the Sofia SIP library.

## 3.2 Package Installation Order

Note that all the RPM packages provided by UniMRCP are signed by a GNU Privacy Guard (GPG) key. Before starting the installation, you may need to import the public key in order to allow the *rpm* utility to verify the packages.

```
rpm --import https://unimrcp.org/keys/unimrcp-gpg-key.public
```

Packages for the APR, APR-Util and Sofia-SIP libraries must be installed first.

```
rpm -ivh uniapr-$aprversion-$packageversion.el$rhelversion.$sarch.rpm
rpm -ivh uniapr-util-$apuverson-$packageversion.el$rhelversion.$sarch.rpm
rpm -ivh unisofia-sip-$sofiaversion-$packageversion.el$rhelversion.$sarch.rpm
```

Then, a package containing common data for the client and the server, and a package for the server should follow.

```
rpm -ivh unimrcp-common-$universion-$packageversion.el$rhelversion.$sarch.rpm
rpm -ivh unimrcp-server-$universion-$packageversion.el$rhelversion.$sarch.rpm
```

Next, a package containing the utility tool *unilicnodegen*, required for license deployment.

```
rpm -ivh unilicnodegen-$toolversion-$packageversion.el$rhelversion.$sarch.rpm
```

Next, a package containing the libevent library.

```
rpm -ivh unilibevent-$libeventversion-$packageversion.el$rhelversion.$sarch.rpm
```

Finally, a package containing the GoVivaceSR plugin should follow.

```
rpm -ivh unimrcp-govivace-sr-$universion-$packageversion.el$rhelversion.noarch.rpm
```

# 4 Obtaining License

The GoVivaceSR plugin to the UniMRCP server is a commercial product, which requires a license file to be installed.

## 4.1 License Type

The following license types are available:

- Trial
- Production
- Test and Development

## 4.2 Node Information

The license files are bound to a node the product is installed on. In order to obtain a license, the corresponding node information needs to be retrieved and submitted for generation of a license file.

Use the installed tool *unilicnodegen* to retrieve the node information.

```
/opt/unimrcp/bin/unilicnodegen
```

As a result, a text file *uninode.info* will be saved in the current directory. Submit the file *uninode.info* for license generation to [services@unimrcp.org](mailto:services@unimrcp.org) by mentioning the product name in the subject.

## 4.3 License Installation

The license file needs to be placed into the directory */opt/unimrcp/data*.

```
cp umsgovivacesr_*.lic /opt/unimrcp/data
```

# 5 Configuring Server and Plugin

## 5.1 Plugin Factory Configuration

In order to load the GoVivaceSR plugin into the UniMRCP server, open the file *unimrcpserver.xml*, located in the directory */opt/unimrcp/conf*, and add the following entry under the XML element *<plugin-factory>*. Disable other recognition plugins, if available. The remaining demo plugins might also be disabled, if not installed.

```
<!-- Factory of plugins (MRCP engines) -->
<plugin-factory>
  <engine id="Demo-Synth-1" name="demosynth" enable="true"/>
  <engine id="Demo-Recog-1" name="demorecog" enable="false"/>
  <engine id="Demo-Verifier-1" name="demoverifier" enable="true"/>
  <engine id="Recorder-1" name="mrcprecorder" enable="true"/>
  <engine id="GoVivace-SR-1" name="umsgovivacesr" enable="true"/>
</plugin-factory>
```

## 5.2 RTP Configuration

In order to support audio data sampled at 16 kHz, the corresponding codecs needs to be specified in the configuration file *unimrcpserver.xml* under the XML element *<rtp-settings>* as follows.

```
<rtp-settings id="RTP-Settings-1">
  <codecs own-preference="false"> PCMU PCMA L16/96/8000 telephone-event/101/8000
    PCMU/97/16000 PCMA/98/16000 L16/99/16000 telephone-
    event/102/16000</codecs>
</rtp-settings>
```

For the basic verification test to work, similar settings should be specified in the client configuration file *unimrcpclient.xml* as well.

```
<rtp-settings id="RTP-Settings-1">
  <codecs>PCMU PCMA L16/96/8000 telephone-event/101/8000 PCMU/97/16000
    PCMA/98/16000 L16/99/16000 telephone-event/102/16000</codecs>
</rtp-settings>
```

## 5.3 Logger Configuration

In order to enable log output from the plugin and set filtering rules, open the configuration file *logger.xml*,

located in the directory `/opt/unimrcp/conf`, and add the following entry under the element `<sources>`.

```
<source name="GOVIVACESR-PLUGIN" priority="INFO" masking="NONE"/>
```

## 5.4 Plugin Configuration

The configuration file of GoVivace plugin is `umsgovivacesr.xml`, located in the directory `/opt/unimrcp/conf`.

While default settings should be sufficient for generic use, service endpoints need to be configured accordingly.

```
<!-- Server
Attributes:
* language
    This parameter specifies the language supported by the server.
* sampling-rate
    This parameter specifies the sampling rate supported by the server.
* uri
    This parameter specifies the Service URI of the server.
* method
    This parameter specifies the method supported by the server.
* secret-key
    This parameter specifies a secret key used for authentication to the server.
Elements:
* None
-->
<server name="gender-1" language="en-US" sampling-rate="8000"
    uri="wss://services.govivace.com:7684" method="GenderId" secret-key="****"/>
<server name="emotion-1" language="en-US" sampling-rate="8000"
    uri="wss://services.govivace.com:7687" method="EmotionId" secret-key="****"/>
<server name="language-1" language="en-US" sampling-rate="8000"
    uri="wss://services.govivace.com:7686" method="LanguageId" secret-key="****"/>
<server name="keyword-1" language="en-US" sampling-rate="8000"
    uri="wss://services.govivace.com:49149" method="telephony" secret-key="****"/>
<server name="grxml-1" language="en-US" sampling-rate="8000"
    uri="ws://198.199.70.106:49162" method="answer" secret-key="****"/>
```

```
<server name="grxml-2" language="en-US" sampling-rate="8000"  
  uri="ws://198.199.70.106:49162" method="location" secret-key="***/>  
  
<server name="grxml-3" language="en-US" sampling-rate="8000"  
  uri="ws://198.199.70.106:49162" method="duration" secret-key="***/>
```

Installation of the GoVivace server is not covered in this document.

Refer to the *Usage Guide* for more information.

# 6 Validating Setup

Validate your setup by using the sample UniMRCP client and server applications on the same host. The default configuration and data files should be sufficient for a basic test.

## 6.1 Launching Server

Launch the UniMRCP server application.

```
cd /opt/unimrcp/bin  
./unimrcpserver
```

In the server log output, check whether the plugin is normally loaded.

```
[INFO] Load Plugin [GoVivace-SR-1] [/opt/unimrcp/plugin/umsgovivacesr.so]
```

Next, check for the license information.

```
[NOTICE] UniMRCP GoVivaceSR License  
  
-product name:  umsgovivacesr  
-product version: 1.0.0  
-license owner:  -  
-license type:   trial  
-issue date:    2019-05-31  
-exp date:     2019-06-30  
-channel count: 2  
-feature set:   0
```

## 6.2 Launching Client

Note: the optional package *umc-addons* must be installed for this test to work.

Launch the sample UniMRCP client application *umc*.

```
cd /opt/unimrcp/bin  
./umc
```

## Gender Identification

Run a typical scenario for gender identification by issuing the command `run gv1` from the console of the *umc* client application.

```
run gv1
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file to recognize.

Check for the NLSML results to be returned as expected.

```
<?xml version="1.0"?>
<result>
  <interpretation grammar="builtin:speech/GenderId" confidence="0.95">
    <instance>
      <status>0</status>
      <message>Gender identification is successful</message>
      <gender>male</gender>
      <string-confidence>0.952294</string-confidence>
      <processing-time>1.052527</processing-time>
      <input-speech-duration>0.810000</input-speech-duration>
    </instance>
    <input mode="speech"></input>
  </interpretation>
</result>
```

## Emotion Identification

Run a typical scenario for emotion identification by issuing the command `run gv2` from the console of the *umc* client application.

```
run gv2
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file to recognize.

Check for the NLSML results to be returned as expected.

```
<?xml version="1.0"?>
<result>
  <interpretation grammar="builtin:speech/EmotionId" confidence="1.00">
```

```
<instance>
  <status>0</status>
  <message>Emotion identification is successful</message>
  <emotion>angry</emotion>
  <emotion-score>0.999981</emotion-score>
  <processing-time>0.344103</processing-time>
</instance>
<input mode="speech"></input>
</interpretation>
</result>
```

## Language and Accent Identification

Run a typical scenario for language and accent identification by issuing the command `run gv3` from the console of the `umc` client application.

```
run gv3
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file to recognize.

Check for the NLSML results to be returned as expected.

```
<?xml version="1.0"?>
<result>
  <interpretation grammar="builtin:speech/LanguageId" confidence="0.81">
    <instance>
      <status>0</status>
      <message>Language and Accent identification is successful</message>
      <language>english</language>
      <score>0.805773</score>
      <processing-time>0.861588</processing-time>
      <enrollment-audio-time>0.000000</enrollment-audio-time>
    </instance>
    <input mode="speech"></input>
  </interpretation>
</result>
```

## Keyword Spotting

Run a typical scenario for keyword spotting by issuing the command `run gv4` from the console of the `umc` client application.

```
run gv4
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file to recognize.

Check for the NLSML results to be returned as expected.

```
<?xml version="1.0"?>
<result>
  <interpretation grammar="builtin:speech/telephony" confidence="1.00">
    <instance>call study</instance>
    <input mode="speech">call study</input>
  </interpretation>
</result>
```

Visually inspect the log output for any possible warnings or errors.

Note that utterances are stored in the *var* directory, if the corresponding parameter is enabled in the configuration file *umsgovivacesr.xml* and/or requested by the client.
