1 Overview

This guide describes how to obtain and install binary packages for the Julius plugin to the UniMRCP server on Debian-based Linux distributions. The document is intended for system administrators and developers.

1.1 Applicable Versions

Instructions provided in this guide are applicable to the following versions.

<table>
<thead>
<tr>
<th></th>
<th>UniMRCP 1.5.0 and above</th>
<th>UniMRCP Julius Plugin 1.0.0 and above</th>
</tr>
</thead>
</table>

1.2 Supported Distributions

UniMRCP binary packages are currently available only for x86_64 (64-bit) architecture.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>32-bit</th>
<th>64-bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ubuntu 14.04 LTS (trusty)</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Ubuntu 16.04 LTS (xenial)</td>
<td></td>
<td>✓</td>
</tr>
</tbody>
</table>

Note: packages for other distributions can be made available upon request. For more information, contact services@unimrcp.org.

1.3 Authentication

UniMRCP binary packages are available to authenticated users only. In order to register a free account with UniMRCP, please visit the following page.

| https://www.unimrcp.org/profile-registration |

Note: a new account needs to be verified and activated prior further proceeding.
2 Installing Deb Packages Using Apt-Get

Using the APT package handling utility (apt-get) is recommended for installation of UniMRCP binary packages.

2.1 Repository Configuration

The content of a typical configuration file of the APT repository, to be placed in /etc/apt/sources.list.d/unimrcp.list, is provided below.

```
deb [arch=amd64] https://username:password@unimrcp.org/repo/apt/ distr main
```

The `username` and `password` fields included in the HTTPS URI must be replaced with the corresponding account credentials.
The `distr` field must be replaced with the corresponding distribution code name such as `trusty`, `xenial`, etc.

2.2 GnuPG Key

For verification of binary packages, UniMRCP provides a public GnuPG key, which can be retrieved and installed as follows.

```
wget -O - https://unimrcp.org/keys/unimrcp-gpg-key.public | sudo apt-key add -
```

2.3 Repository Update

In order to check for updates and apply the changes in the APT configuration, use the following command.

```
sudo apt-get update
```

2.4 Julius Plugin Installation

In order to install the Julius plugin package, including all the dependencies, use the following command.

```
sudo apt-get install unimrcp-julius
```

As a result, `apt-get` will check and prompt to download all the required packages by installing them in the directory `/opt/unimrcp`. 
In order to install the en-US model package for Julius, use the following command.

```
sudo apt-get install unimrcp-julius-model-en-us
```

Note: this package provides acoustic data files required for the Julius engine to perform recognition for the en-US language. Packages for other languages can be made available upon request.

In order to install the additional data files for the sample client application *umc*, the following command can be used.

```
sudo apt-get install umc-addons
```

Note: this package is optional and provides additional data which can be used for validation of basic setup.
3 Installing Deb Packages Manually

UniMRCP deb packages can be installed manually using the *dpkg* utility. Note, however, that the system administrator should take care of package dependencies and install all the packages in appropriate order.

The deb packages have the following naming convention:

```
$packagename_$universion-$distr_$arch.deb
```

where

- *packagename* is the name of a package
- *universion* is the UniMRCP version
- *distr* is the distribution code name (trusty, xenial, …)
- *arch* is the architecture (amd64, i386, all, …)

3.1 Package List

The following is a list of UniMRCP deb packages required for the installation of Julius plugin.

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unimrcp-julius</td>
<td>Julius plugin to the server.</td>
</tr>
<tr>
<td>umc-addons</td>
<td>Sample en-US data files used with umc. [Optional]</td>
</tr>
<tr>
<td>unilicnodegen</td>
<td>Node information retrieval tool, required for license deployment.</td>
</tr>
<tr>
<td>unimrcp-server</td>
<td>Shared library and application of the server.</td>
</tr>
<tr>
<td>unimrcp-client</td>
<td>Shared libraries and sample applications of the client. [Optional]</td>
</tr>
<tr>
<td>unimrcp-demo-plugins</td>
<td>Set of demo plugins to the server. [Optional]</td>
</tr>
<tr>
<td>unimrcp-common</td>
<td>Data common for the client and the server.</td>
</tr>
<tr>
<td>uniapr</td>
<td>UniMRCP edition of the Apache Portable Runtime (APR) library.</td>
</tr>
</tbody>
</table>
### Install UniMRCP

<table>
<thead>
<tr>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unisofia-sip</td>
<td>UniMRCP edition of the Sofia SIP library.</td>
</tr>
</tbody>
</table>

### Package Installation Order

Packages for APR, APR-Util and Sofia-SIP libraries must be installed first.

```
sudo dpkg --install uniapr_$aprversion-$distr_$arch.deb
sudo dpkg --install uniapr-util_$apuversion-$distr_$arch.deb
sudo dpkg --install unisofia-sip_$sofiaversion-$distr_$arch.deb
```

Then, a package containing common data for the client and the server, and a package for the server should follow.

```
sudo dpkg --install unimrcp-common_$universion-$distr_$arch.deb
sudo dpkg --install unimrcp-server_$universion-$distr_$arch.deb
```

Next, a package containing the utility tool `unilicnodegen`, required for license deployment.

```
sudo dpkg --install unilicnodegen_$toolversion-$distr_$arch.deb
```

Next, a package containing the Julius plugin should follow.

```
sudo dpkg --install unimrcp-julius_$universion-$distr_$arch.deb
```

Finally, one or more packages corresponding to a particular language should follow.

```
sudo dpkg --install unimrcp-julius-model-en-us_$universion-$distr_all.deb
```
4 Obtaining License

The Julius plugin to the UniMRCP server is a commercial product, which requires a license file to be installed.

4.1 License Type

The following license types are available:

- Trial
- Production
- Test and Development

4.2 Node Information

The license files are bound to a node the product is installed on. In order to obtain a license, the corresponding node information needs to be retrieved and submitted for generation of a license file.

Use the installed tool `unilicnodegen` to retrieve the node information.

```
sudo /opt/unimrcp/bin/unilicnodegen
```

As a result, a text file `uninode.info` will be saved in the current directory. Submit the file `uninode.info` for license generation to `services@unimrcp.org` by mentioning the product name in the subject.

4.3 License Installation

The license file needs to be placed into the directory `/opt/unimrcp/data`.

```
sudo cp ums_julius_*_.lic /opt/unimrcp/data
```
5 Configuring Server and Plugin

5.1 Plugin Factory

In order to load the Julius plugin into the UniMRCP server, open the file `unimrcpserver.xml`, located in the directory `/opt/unimrcp/conf`, and add the following entry under the XML element `<plugin-factory>`. Disable other recognition plugins, if available. The remaining demo plugins might also be disabled, if not installed.

```xml
<!-- Factory of plugins (MRCP engines) -->
<plugin-factory>
  <engine id="Demo-Synth-1" name="demosynth" enable="true"/>
  <engine id="Demo-Recog-1" name="demorecog" enable="false"/>
  <engine id="Demo-Verifier-1" name="demoverifier" enable="true"/>
  <engine id="Recorder-1" name="mrcprecorder" enable="true"/>
  <engine id="JRecog-1" name="umsjulius" enable="true"/>
</plugin-factory>
```

5.2 Logger

In order to enable log output from the plugin and set filtering rules, open the configuration file `logger.xml`, located in the directory `/opt/unimrcp/conf`, and add the following entry under the element `<sources>`.

```xml
<source name="JULIUS" priority="INFO" masking="NONE"/>
```

5.3 Julius

The configuration file of the plugin is located in `/opt/unimrcp/conf/umsjulius.xml` and the data files are in the directory `/opt/unimrcp/data/julius`.

Refer to the *Usage Guide* for more information.
6 Validating Setup

Validate your setup by using the sample UniMRCP client and server applications on the same host. The default configuration and data files should be sufficient for a basic test.

6.1 Launching Server

Launch the UniMRCP server application.

```
cd /opt/unimrcp/bin
sudo ./unimrcpserver
```

In the server log output, check whether the plugin is normally loaded.

```
[INFO]   Load Plugin [JRecog-1] [/opt/unimrcp/plugin/umsjulius.so]
```

Next, check for the license information.

```
[NOTICE] UniMRCP Julius License
 -product name:  umsjulius
 -product version: 1.0.0
 -license owner:  Name
 -license type:  trial
 -issue date:  2017-01-28
 -exp date:    2017-02-27
 -channel count:  2
 -feature set:  0
```

Next, make sure that the Julius recognition server processes are normally started and the plugin can connect to them.

```
[INFO] Connected to JServer #0 Control Port localhost:10500 attempt 1
[INFO] Connected to JServer #1 Control Port localhost:10500 attempt 1
[INFO] Connected to JServer #2 Control Port localhost:10500 attempt 1
[INFO] Connected to JServer #3 Control Port localhost:10500 attempt 1
```

6.2 Launching Client

Note: the optional package `umc-addons` must be installed for this test to work.
Launch the sample UniMRCP client application `umc`.

```
cd /opt/unimrcp/bin
./umc
```

Run a typical speech recognition scenario by issuing the command `run j1` from the console of the `umc` client application.

```
run j1
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file `callsteve.pcm` to recognize.

Check for the NLSML results to be returned as expected.

```
<?xml version="1.0"?>
<result>
  <interpretation grammar="request1@form-level" confidence="1.00">
    <instance>call steve</instance>
    <input mode="speech">call steve</input>
  </interpretation>
</result>
```

Visually inspect the log output for any possible warnings or errors.

Note that utterances are stored in the `var` directory, if the corresponding parameter is enabled in the configuration file `umsjulius.xml` and/or requested by the client.
