1 Overview

This guide describes how to obtain and install binary packages for the Yandex Speech Recognition (SR) plugin to the UniMRCP server on Red Hat-based Linux distributions. The document is intended for system administrators and developers.

1.1 Applicable Versions

Instructions provided in this guide are applicable to the following versions.

- UniMRCP 1.6.0 and above
- UniMRCP Yandex SR Plugin 1.0.0 and above

1.2 Supported Distributions

UniMRCP RPMs are currently available for x86_64 (64-bit) architecture only.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Released</th>
<th>End of Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red Hat / Cent OS 7</td>
<td>December 2018</td>
<td>TBA</td>
</tr>
<tr>
<td>Red Hat / Cent OS 8</td>
<td>January 2021</td>
<td>TBA</td>
</tr>
</tbody>
</table>

Note: packages for other distributions can be made available upon request. For more information, contact services@unimrcp.org.

1.3 Authentication

UniMRCP binary packages are available to authenticated users only. In order to register a free account with UniMRCP, please visit the following page.

https://www.unimrcp.org/profile-registration

Note: a new account needs to be verified and activated prior further proceeding.
2 Installing RPMs Using YUM

Using the Yellowdog Updater, Modifier (yum), a command-line package management utility for Red Hat-based distributions, is recommended for installation of UniMRCP binary packages.

2.1 Repository Configuration

The content of a typical yum configuration file, to be placed in /etc/yum.repos.d/unimrcp.repo, is provided below.

```
[unimrcp]
name=UniMRCP Packages for Red Hat / CentOS-$releasever $basearch
baseurl=https://username:password@unimrcp.org/repo/yum/main/rhel$releasever/$basearch/
enabled=1
sslverify=1
gpgcheck=1
gpgkey=https://unimrcp.org/keys/unimrcp-gpg-key.public

[unimrcp-noarch]
name=UniMRCP Packages for Red Hat / CentOS-$releasever noarch
baseurl=https://username:password@unimrcp.org/repo/yum/main/rhel$releasever/noarch/
enabled=1
sslverify=1
gpgcheck=1
gpgkey=https://unimrcp.org/keys/unimrcp-gpg-key.public
```

The username and password fields included in the HTTPS URI must be replaced with the corresponding account credentials.

2.2 Repository Verification

In order to verify that yum can properly connect and access the UniMRCP repository, the following command can be used.

```
yum repolist unimrcp
yum repolist unimrcp-noarch
```

where `unimrcp` and `unimrcp-noarch` are names of the sections set in the yum configuration file above.

In order to retrieve a list of packages the UniMRCP repository provides, the following command can be used.

```
yum --disablerepo="*" --enablerepo="unimrcp" list available
```
2.3 Yandex SR Plugin Installation

In order to install the Yandex SR plugin, including all the dependencies, use the following command.

```
yum install unimrcp-yandex-sr
```

In order to install the additional data files for the sample client application `umc`, the following command can be used.

```
yum install umc-addons
```

Note: this package is optional and provides additional data which can be used for validation of basic setup.
3 Installing RPMs Manually

UniMRCP RPM packages can be installed manually using the `rpm` utility. Note, however, that the system administrator should take care of package dependencies and install all the packages in appropriate order.

The RPM packages have the following naming convention:

```
$packagename-$universion-$packageversion.el$rhelversion.$arch.rpm
```

where

- `packagename` is the name of a package
- `universion` is the UniMRCP version
- `packageversion` is the RPM release version
- `rhelversion` is the Red Hat version
- `arch` is the architecture (x86_64, i686, …)

3.1 Package List

The following is a list of UniMRCP RPM packages required for the installation of the Yandex SR plugin.

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unimrcp-yandex-sr</td>
<td>Yandex SR plugin to the server.</td>
</tr>
<tr>
<td>unigrpc</td>
<td>UniMRCP edition of the gRPC library.</td>
</tr>
<tr>
<td>unilibevent</td>
<td>UniMRCP edition of the libevent library.</td>
</tr>
<tr>
<td>umc-addons</td>
<td>Sample en-US data files used with umc. [Optional]</td>
</tr>
<tr>
<td>unilicnodegen</td>
<td>Node information retrieval tool, required for license deployment.</td>
</tr>
<tr>
<td>unimrcp-server</td>
<td>Shared library and application of the server.</td>
</tr>
<tr>
<td>unimrcp-client</td>
<td>Shared libraries and sample applications of the client. [Optional]</td>
</tr>
<tr>
<td>unimrcp-demo-plugins</td>
<td>Set of demo plugins to the server. [Optional]</td>
</tr>
<tr>
<td>unimrcp-common</td>
<td>Data common for the client and the server.</td>
</tr>
</tbody>
</table>
### 3.2 Package Installation Order

Note that all the RPM packages provided by UniMRCP are signed by a GNU Privacy Guard (GPG) key. Before starting the installation, you may need to import the public key in order to allow the `rpm` utility to verify the packages.

```bash
rpm --import https://unimrcp.org/keys/unimrcp-gpg-key.public
```

Packages for the APR, APR-Util and Sofia-SIP libraries must be installed first.

```bash
rpm -ivh uniapr-$aprversion-$packageversion.el$rhelversion.$arch.rpm
rpm -ivh uniapr-util-$apuversion-$packageversion.el$rhelversion.$arch.rpm
rpm -ivh unisofia-sip-$sofiaversion-$packageversion.el$rhelversion.$arch.rpm
```

Then, a package containing common data for the client and the server, and a package for the server should follow.

```bash
rpm -ivh unimrcp-common-$universion-$packageversion.el$rhelversion.$arch.rpm
rpm -ivh unimrcp-server-$universion-$packageversion.el$rhelversion.$arch.rpm
```

Next, a package containing the utility tool `unilicnodegen`, required for license deployment.

```bash
rpm -ivh unilicnodegen-$toolversion-$packageversion.el$rhelversion.$arch.rpm
```

Next, packages containing the gRPC and libevent libraries.

```bash
rpm -ivh unigrpc-$grpcversion-$packageversion.el$rhelversion.$arch.rpm
rpm -ivh unilibevent-$libeventversion-$packageversion.el$rhelversion.$arch.rpm
```

Finally, a package containing the Yandex SR plugin should follow.
rpm -ivh unimrcp-yandex-sr-$univer$version-$packageversion.el$re$h$ver$version.no$arch.rpm
4 Obtaining License

The Yandex SR plugin to the UniMRCP server is a commercial product, which requires a license file to be installed.

4.1 License Type

The following license types are available:

- Trial
- Production
- Test and Development

4.2 Node Information

The license files are bound to a node the product is installed on. In order to obtain a license, the corresponding node information needs to be retrieved and submitted for generation of a license file.

Use the installed tool `unilicnodegen` to retrieve the node information.

```
/opt/unimrcp/bin/unilicnodegen
```

As a result, a text file `uninode.info` will be saved in the current directory. Submit the file `uninode.info` for license generation to `services@unimrcp.org` by mentioning the product name in the subject.

4.3 License Installation

The license file needs to be placed into the directory `/opt/unimrcp/data`.

```
 cp umsyandexsr_*.lic /opt/unimrcp/data
```
5 Obtaining Service Credentials

In order to utilize the Yandex SpeechKit API, corresponding service credentials need to be retrieved from the Yandex Cloud portal and further installed to the UniMRCP server.

5.1 Service Subscription

Subscribe to the Yandex Speech to Text API.

https://cloud.yandex.com/docs/speechkit/concepts/auth

Obtain your OAuth token.

1. Log in to Yandex using your Yandex Passport account.
2. Get an OAuth token from Yandex OAuth. To do this, follow the link, click Allow and copy the issued OAuth token.

5.2 Installation of Credentials

Create a text file yandex.subscription.key in the directory /opt/unimrcp/data.

sudo nano /opt/unimrcp/data/yandex.subscription.key

Store your OAuth token in the text file.

***********************************

The provided OAuth token is used to obtain and periodically revalidate an IAM token.
6 Configuring Server and Plugin

6.1 Plugin Factory Configuration

In order to load the Yandex SR plugin into the UniMRCP server, open the file `unimrcpserver.xml`, located in the directory `/opt/unimrcp/conf`, and add the following entry under the XML element `<plugin-factory>`. Disable other recognition plugins, if available. The remaining demo plugins might also be disabled, if not installed.

```
<!-- Factory of plugins (MRCP engines) -->
<plugin-factory>
  <engine id="Demo-Synth-1" name="demosynth" enable="true"/>
  <engine id="Demo-Recog-1" name="demorecog" enable="false"/>
  <engine id="Demo-Verifier-1" name="demoverifier" enable="true"/>
  <engine id="Recorder-1" name="mrcprecorder" enable="true"/>
  <engine id="Yandex-SR-1" name="umsyandexsr" enable="true"/>
</plugin-factory>
```

6.2 Logger Configuration

In order to enable log output from the plugin and set filtering rules, open the configuration file `logger.xml`, located in the directory `/opt/unimrcp/conf`, and add the following entry under the element `<sources>`.

```
<source name="YANDEXSR-PLUGIN" priority="INFO" masking="NONE"/>
```

6.3 Yandex SR Plugin Configuration

The configuration file of the plugin is located in `/opt/unimrcp/conf/umsyandexsr.xml`. Default settings should be sufficient for general use.

Refer to the Usage Guide for more information.
7 Validating Setup

Validate your setup by using the sample UniMRCP client and server applications on the same host. The default configuration and data files should be sufficient for a basic test.

7.1 Setting up Folder ID

The Yandex SpeechKit folder identifier must be specified in the configuration file of the plugin, located in /opt/unimrcp/conf/umsyandexsr.xml.

```
<streaming-recognition
    folder-id="***************"
    single-utterance="true"
    interim-results="true"
    start-of-input="service-originated"
    language="en-US"
    max-alternatives="1"
    alternatives-below-threshold="false"
    confidence-format="auto"
    results-indent="2"
    skip-unsupported-grammars="true"
    transcription-grammar="transcribe"
    auth-validation-period="3600"
/>
```

7.2 Launching Server

Start the UniMRCP server as a service.

```
systemctl start unimrcp
```

In the server log output, check whether the plugin is normally loaded.

```
[INFO] Load Plugin [Yandex-SR-1] [/opt/unimrcp/plugin/umsyandexsr.so]
```

Next, check for the license information.

```
[NOTICE] UniMRCP YandexSR License

-product name: umsyandexsr
-product version: 1.0.0
```
7.3 Launching Client

Note: the optional package umc-addons must be installed for this test to work.

Launch the sample UniMRCP client application umc.

```
    cd /opt/unimrcp/bin
    ./umc
```

Run a typical speech recognition scenario by issuing the command `run gsr1` from the console of the umc client application.

```
    run gsr2
```

This command sends a RECOGNIZE request to the server and then starts streaming a sample audio input file `callsteve.pcm` to recognize.

Check for the NLSML results to be returned as expected.

```
    <?xml version="1.0"?>
    <result>
        <interpretation grammar="command" confidence="1">
            <instance>Dial 5</instance>
            <input mode="speech">Dial 5</input>
        </interpretation>
    </result>
```

Visually inspect the log output for any possible warnings or errors.

Note that utterances are stored in the var directory, if the corresponding parameter is enabled in the configuration file `umsyandexsr.xml` and/or requested by the client.
